Introduction

SFA 15 are standard, **back pressure dependent** safety relief valves in angle-way execution, specially designed for protection of vessels and other components against excessive pressure.

The valve is designed to meet the strict quality demands and safety requirements for refrigeration installations, specified by the international classification societies.

The valve is recommended as an external and internal safety relief valve in refrigeration plants. The spring housing is closed tightly to avoid refrigerant leakage.

The inlet flow diameters of the valves are:  
- 13 mm (½ in.) for SFA 15

The valves can be delivered with set pressures between 10 and 40 bar g (145 and 580 psi g).

Standard pressure setting valves having "TÜV Pressure Setting Certificate" with each valve, are also available.

Features

- Applicable for the refrigerants R717 (ammonia, NH<sub>3</sub>), HFC, HCFC (e.g. R22, R134a, R404A) and other refrigerants (dependent on sealing materials compatibility) within a temperature range of -30°C/+100°C (-22°F/+212°F).
- Classification: To get an updated list of certification on the products please contact your local Danfoss Sales Company.

**Technical data**

- Refrigerants  
Applicable for the refrigerants R717 (ammonia, NH<sub>3</sub>), HFC, HCFC (e.g. R22, R134a, R404A) and other refrigerants dependent on sealing material compatibility within a temperature range of -30°C/+100°C (-22°F/+212°F). Flammable hydrocarbons are not recommended. For further information please contact your local Danfoss Sales Company.
- Pressure  
Pressure setting range: 10 - 40 bar g (145 - 580 psi g). For further information please contact your local Danfoss Sales Company.
- Pressure setting  
The operating pressure of the plant should be at least 15% below the set pressure. This allows a perfect re-seating of the safety relief valve after having been activated.
- Temperature range  
-30/+100°C (-22/+212°F)

Important: The SFA safety relief valve is dependent on the back pressure (if the back pressure is higher than the atmospheric pressure, the opening pressure will be higher than stated set pressure).  
Special circumstances such as vibrations (which should be avoided) and oscillating pressure may require an increased difference between the operational pressure and the closing pressure.

*Pressure Equipment Directive (PED)*

The SFA valves are approved in accordance with the European standard specified in the Pressure Equipment Directive and are CE marked.

For further details / restrictions - see Installation Instruction

SFA valves	
Nominal bore	13 mm (0.512 in.)
Classified for	Fluid group I
Category	IV

Design

SFA is designed as a **standard safety relief valve** (DIN 3320), which is recommended for refrigeration plants. On a rise in pressure above the set pressure, the safety relief valve will initially start opening slightly, to minimise the outlet of

refrigerant. If the pressure continues to increase, the valve will open fully. The safety relief valve will be fully open before the pressure is 10% higher than set pressure, and fully closed before the pressure is 10% below set pressure.

*Connections*

Available with the following connections:

- Outside pipe thread T (ISO 228/1)
- Welding fittings (DIN 2448)

*Housing*

Made of special steel approved for low temperature operation. Spindle, cone, and seat are made of stainless steel, to ensure precise operation even during extraordinary conditions. The gasket of the valve cone is made of a special chloroprene (neoprene) compound.

*Installation*

To ensure exact operation of the safety relief valve it should be installed with the spring housing upwards. If the valve is mounted as an internal safety relief valve without any demand for exact opening pressure, the valve may be fitted with the spring housing in other positions. When the valve is mounted, it is important to avoid the influence of static, dynamic and thermal stress.

A very precise technique has been applied for the production of the seal. However, this seal can still be damaged, if dirt is blown from the pipe system into the valve.

It is recommended that safety relief valves exhaust into the open air with a U-pipe filled with oil on the discharge branch, to prevent dirt from penetrating into the valve. It is also recommended that the valves be installed in pairs in conjunction with the double stop valve type DSV 1 or 2. For further information please see the technical leaflet for DSV.

*Re-calibration/servicing*

In certain countries the authorities demand that the valves are readjusted at least once a year (see local rules).

*Control/Identification*

After adjustment of the set pressure at Danfoss, the valves are sealed. For that reason Danfoss can only guarantee correct operation, as long as the seal remains unbroken.

All valves are provided with a metal plate with the following information:

- Flow diameter
- Set pressure
- Date of production
- Production number
- Type approved code.

*Transport/Handling*

The valves are fitted with special protection covers and packed into purpose made transportation cartons.

It is important that the cover remains fitted around the valve until it is installed.

*To ensure the exact and precise operation of the valve it must be handled with care.*

Safety valve	Double stop valve		Max. pressure
	CE marked	Not CE marked	
SFA 15	DSV 1		40 bar (580 psi)
	DSV 2		40 bar (580 psi)
		DSV 15	25 bar (363 psi)

**Capacity**

The design and construction of the safety relief valve has been tested and approved by TÜV. This test comprises control of the function of the valve as well as measuring of the capacity, which is the basis of the curves and tables on the following pages. The values in the table are based on saturated gas.

If e.g. back pressure or superheated gas have to be taken into consideration, the formulas or the Danfoss computation program (DIRcalc™) can be used.

*Table 1.*

Valve	Nominal size		Flow diameter $d_o$	Flow area $A_0$	De-rated, certified coefficient of discharge $K_{dr}$
	Inlet	Outlet			
SFA 15	15 mm	20 mm	13 mm	133 mm <sup>2</sup>	0.73
	½ in.	¾ in.	0.512 in.	0.206 in <sup>2</sup>	

The discharge capacity of the safety relief valves are based on (ISO 4126-1/EN 1268-1 / prEN 1313 6 (1998)).

$$q_m = 0.2883 \times C \times A_0 \times K_{dr} \times K_b \sqrt{v}$$

$q_m$  Discharge capacity (kg/h).

$C$  Discharge function depending of the actual refrigerant ( $\kappa$ ) see table 2 (-).

$A_0$  Flow area of the safety relief valve (mm<sup>2</sup>).

$K_{dr}$  De-rated coefficient of discharge ( $K_{dr} = K_d \times 0.9$ ), (the  $K_{dr}$  is certified by TÜV) see table 1 (-).

$K_b$  Correction factor for sub-critical flow (-).

$K_b = 1.0$  when the back pressure is lower than approx.  $0.5 \times$  relieving pressure ( $P_b < 0.5 \times p$ ).

*For all SFV safety valves  $K_b = 1.0$*

$v$  Specific volume of the vapour at the relieving pressure  $p$ . (m<sup>3</sup>/kg).

$p_{set}$  Set pressure, the predetermined pressure at which a pressure relief valve under operation starts to open ( $p_{set}$  is indicated on the metal plate on the safety relief valve).  
(bar gauge)

$p_{atm}$  Atmospheric pressure (1 bar).

$p$  Relieving pressure,  $p = p_{set} \times 1.1 + P_{atm}$  (bar absolute).

For further details see the above-mentioned ISO or EN standards.
